03. Aurora Store Updates

03. Backups

Local Backups

Now, most of the applications that your run already have the data backed up by the app itself on your HomeLab server. So what is the point of backing up your GrapheneOS Phone ? Well things that are not backed up is the configuration of your phone itself. That is

1. The applications that you have installed and the app data
2. Files and folders you select to be backed up: This can be for instance local documents/downloads folders that contains data that is not used inside an application
3. System data: Such as your phone's settings, home screen layout, wallpaper, saved Wifi Networs, local contacts, and emergency information.

Backups are configured per user profile, so you need to setup a backup for all the different profiles if you want all profiles to be saved.

GrapheneOS local backups are stored in the device’s home directory in the hidden `.SeedVaultAndroidBackup` folder. Turn on “Show hidden files” in a file manager to see it.

Basic Apps

Apple Migration

This chapter discusses how you can migrate from Apple to Graphene OS in the simplest and most effective way possible.

Android Migration

This chapter discusses how you can migrate from Google Android to Graphene OS in the simplest and most effective way possible.
